

Path 2: Cyber Security 101 > Module 1: Start Your Cyber Security Journey > Room 3: Search Skills

<https://tryhackme.com/room/searchskills>

Search Skills:

Learn to efficiently search the Internet and use specialized search engines and technical docs.

>> Task 1: Introduction

A quick Google search for **learn cyber security** returned around 600 million hits, while a search for **learn hacking** returned more than double that number! The number might have grown even further when you go through this lesson.

We are surrounded by information. Do you prefer to surrender in the face of information overload and accept the first few results you get? Or do you like to acquire the necessary search skills to find and access what you are looking for? This lesson aims to help you with the latter.

Learning Objectives:

The goal of this lesson is to teach

:

- Evaluate information sources
- Use search engines efficiently
- Explore specialized search engines
- Read technical documentation
- Make use of social media
- Check news outlets

Q1) Check how many results you get when searching for **learn hacking**. At the time of writing, we got 1.5 billion results when searching on Google.

Answer: No Answer Needed

>> Task 2: Evaluation of Search Results

On the Internet, everyone can publish their writings. It can be in the form of blog posts, articles, or social media posts. It can be even in more subtle ways, such as by editing a public wiki page. This ability makes it possible for anyone to voice their unfounded claims. Everyone can express their opinion about best cyber security practices, future programming trends, and how to best prepare for a DevSecOps interview.

It is our job, as readers, to evaluate the information. We will mention a few things to consider when evaluating information:

- **Source:** Identify the author or organization publishing the information. Consider whether they are reputable and authoritative on the subject matter. Publishing a blog post does not make one an authority on the subject.
- **Evidence and reasoning:** Check whether the claims are backed by credible evidence and logical reasoning. We are seeking hard facts and solid arguments.
- **Objectivity and bias:** Evaluate whether the information is presented impartially and rationally, reflecting multiple perspectives. We are not interested in authors pushing shady agendas, whether to promote a product or attack a rival.
- **Corroboration and consistency:** Validate the presented information by corroboration from multiple independent sources. Check whether multiple reliable and reputable sources agree on the central claims.

Q1) What do you call a cryptographic method or product considered bogus or fraudulent?

Answer: Snake oil

Q2) What is the name of the command replacing **netstat** in Linux systems?

Answer: ss (socket statistics)

>> Task 3: Search Engines

Every one of us has used an Internet search engine; however, not everyone has tried to harness the full power of an Internet search engine. Almost every Internet search engine allows you to carry out advanced searches. Consider the following examples:

- Google (https://www.google.com/advanced_search)
- Bing (<https://support.microsoft.com/en-us/topic/advanced-search-options-b92e25f1-0085-4271-bdf9-14aaea720930>)
- DuckDuckGo (<https://duckduckgo.com/duckduckgo-help-pages/results/syntax>)

Let's consider the search operators supported by Google.

"exact phrase" : Double quotes indicate that you are looking for pages with the exact word or phrase. For example, one might search for **"passive reconnaissance"** to get pages with this exact phrase.

site: : This operator lets you specify the domain name to which you want to limit your search. For example, we can search for success stories on TryHackMe using **site:tryhackme.com success stories**.

-: The **minus** (-) sign allows you to omit search results that contain a particular word or phrase. For example, you might be interested in learning about the pyramids, but you don't want to view tourism websites; one approach is to search for **pyramids -tourism** or **-tourism pyramids**.

filetype: : This search operator is indispensable for finding files instead of web pages. Some of the file types you can search for using Google are Portable Document Format (PDF), Microsoft Word Document (DOC), Microsoft Excel Spreadsheet (XLS), and Microsoft PowerPoint Presentation (PPT). For example, to find cyber security presentations, try searching for **filetype:ppt cyber security**.

You can check more advanced controls in various search engines in this advanced search operators list (<https://github.com/cipher387/Advanced-search-operators-list>); however, the above provides a good starting point. Check your favourite search engine for the supported search operators.

Q1) How would you limit your Google search to PDF files containing the terms cyber warfare report?

Answer: `filetype:pdf cyber warfare report`

Q2) What phrase does the Linux command **ss** stand for?

Answer: socket statistics

>> Task 4: Specialized Search Engines

You are familiar with Internet search engines; however, how much are you familiar with specialized search engines? By that, we refer to search engines used to find specific types of results.

- ♦ Shodan (<https://www.shodan.io/>):

Let's start with Shodan, a search engine for devices connected to the Internet. It allows you to search for specific types and versions of servers, networking equipment, industrial control systems, and IoT devices. You may want to see how many servers are still running Apache 2.4.1 and the distribution across countries. To find the answer, we can search for `apache 2.4.1`, which will return the list of servers with the string **apache 2.4.1** in their headers.

Consider visiting Shodan Search Query Examples (<https://www.shodan.io/search/examples>) for more examples. Furthermore, you can check Shodan trends (<https://trends.shodan.io/>) for historical insights if you have a subscription.

- ♦ Censys (<https://search.censys.io/>):

At first glance, Censys appears similar to Shodan. However, Shodan focuses on Internet-connected devices and systems, such as servers, routers, webcams, and IoT devices. Censys, on the other hand, focuses on Internet-connected hosts, websites, certificates, and other Internet assets. Some of its use cases include enumerating domains in use, auditing open ports and services, and discovering rogue assets within a network. You might want to check Censys Introductory Use Cases (<https://docs.censys.com/docs/ls-introductory-use-cases>).

- ♦ VirusTotal (<https://www.virustotal.com/gui/home/upload>):

VirusTotal is an online website that provides a virus-scanning service for files using multiple antivirus engines. It allows users to upload files or provide URLs to scan them against numerous antivirus engines and website scanners in a single operation. They can even input file hashes to check the results of previously uploaded files.

- ♦ Have I Been Pwned (<https://haveibeenpwned.com/>):

Have I Been Pwned (HIBP) does one thing; it tells you if an email address has appeared in a leaked data breach. Finding one's email within leaked data indicates leaked private information and, more importantly, passwords. Many users use the same password across multiple platforms, if one platform is breached, their password on other platforms is also exposed. Indeed, passwords are usually stored in encrypted format; however, many passwords are not that complex and can be recovered using a variety of attacks.

Q1) What is the top country with **lighttpd** servers?

Answer: United States

Q2) What does BitDefenderFalx detect the file with the hash

2de70ca737c1f4602517c555ddd54165432cf231ffc0e21fb2e23b9dd14e7fb4 as?

Answer: Android.Riskware.Agent.LHH

>> Task 5: Vulnerabilities and Exploits

♦ CVE:

We can think of the Common Vulnerabilities and Exposures (CVE) program as a dictionary of vulnerabilities. It provides a standardized identifier for vulnerabilities and security issues in software and hardware products. Each vulnerability is assigned a CVE ID with a standardized format like **CVE-2024-29988**. This unique identifier (CVE ID) ensures that everyone from security researchers to vendors and IT professionals is referring to the same vulnerability, CVE-2024-29988 (<https://nvd.nist.gov/vuln/detail/CVE-2024-29988>) in this case.

The MITRE Corporation maintains the CVE system. For more information and to search for existing CVEs, visit the CVE Program website (<https://www.cve.org/>). Alternatively, visit the National Vulnerability Database (NVD) website (<https://nvd.nist.gov/>). The screenshot below shows CVE-2014-0160, also known as Heartbleed.

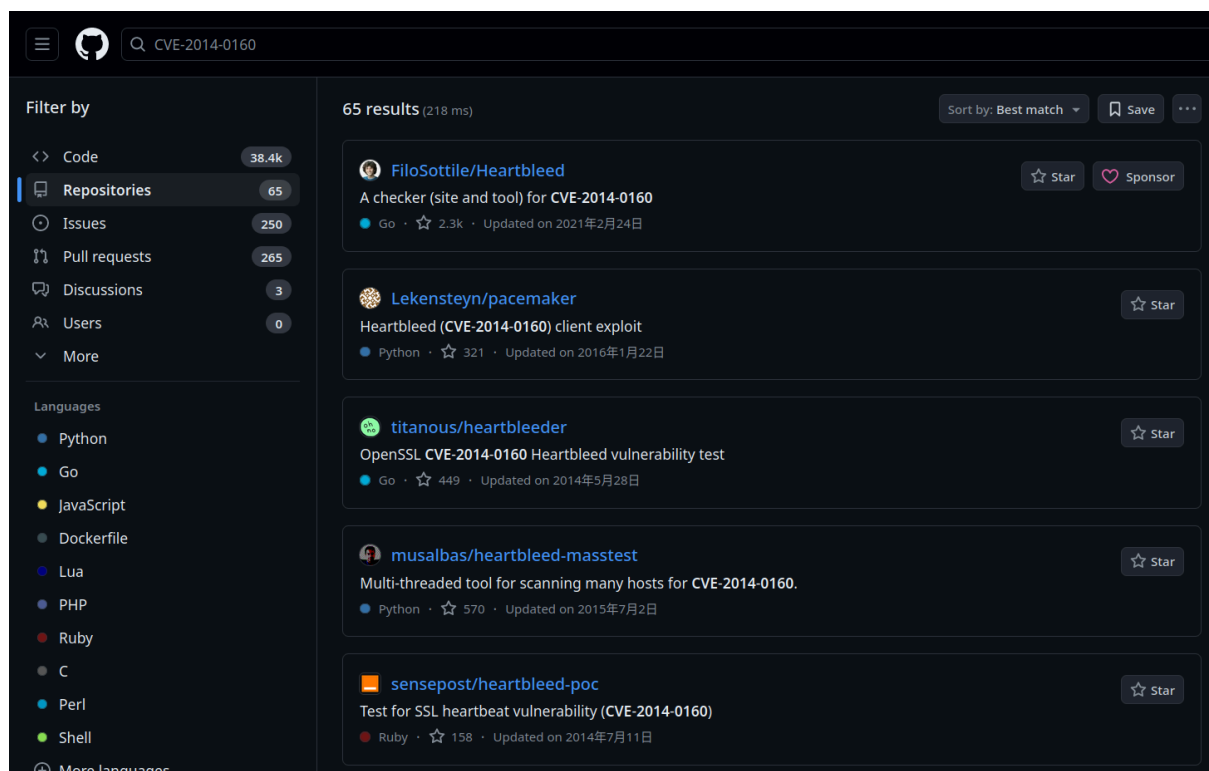

The screenshot shows the CVE-2014-0160 page on the CVE Program website. The page has a dark blue header with the CVE logo and navigation links: About, Partner Information, Program Organization, Downloads, Resources & Support, and a Report/Request link. The main content area is white and features the CVE ID 'CVE-2014-0160' with a 'PUBLISHED' status tag and a 'View JSON' link. Below this is a section titled 'Important CVE JSON 5 Information' with a plus icon. The 'Assigner' is listed as 'Red Hat, Inc.' and the 'Published' date is '2014-04-07' with an 'Updated' date of '2022-11-15'. The description states: 'The (1) TLS and (2) DTLS implementations in OpenSSL 1.0.1 before 1.0.1g do not properly handle Heartbeat Extension packets, which allows remote attackers to obtain sensitive information from process memory via crafted packets that trigger a buffer over-read, as demonstrated by reading private keys, related to d1_both.c and t1_lib.c, aka the Heartbleed bug.' There is a 'Product Status' section with a plus icon and a link to 'Learn About the Versions Section'. Below this is a note 'Information not provided'. The 'References' section lists several links: 'https://support.f5.com/kb/en-us/solutions/public/15000/100/sol15159.html?sr=36517217', 'securitytracker.com: 1030077', 'seclists.org: 20140408 heartbleed OpenSSL bug CVE-2014-0160', 'http://www.getchef.com/blog/2014/04/09/chef-server-heartbleed-cve-2014-0160-releases/', and 'debian.org: DSA-2896'.

♦ Exploit Database (<https://www.exploit-db.com/>):

There are many reasons why you would want to exploit a vulnerable application; one would be assessing a company's security as part of its red team. Needless to say, we should not try to exploit a vulnerable system unless we are given permission, usually via a legally binding agreement.

Now that we have permission to exploit a vulnerable system, we might need to find a working exploit code. One resource is the Exploit Database. The Exploit Database lists exploit codes from various authors; some of these exploit codes are tested and marked as verified.

GitHub (<https://github.com/>), a web-based platform for software development, can contain many tools related to CVEs, along with proof-of-concept (PoC) and exploit codes. To demonstrate this idea, check the screenshot below of search results on GitHub that are related to the Heartbleed vulnerability.

Q1) What utility does CVE-2024-3094 refer to?

Answer: xz

>> Task 6: Technical Documentation

One vital skill to acquire is to look up official documentation. We will cover a few examples of official documentation pages.

♦ Linux Manual Pages:

Long before the Internet was everywhere, how would you get help using a command in a Linux or Unix-like system? The answer would be checking the manual page, man page for short. On Linux and every Unix-like system, each command is expected to have a man page. In fact, man pages also exist for system calls, library functions, and even configuration files.

Let's say we want to check the manual page for the command **ip**. We issue the command **man ip**.

If you prefer to read the man page of **ip** in your web browser, just type **man ip** in your favourite search engine. This page (<https://linux.die.net/man/8/ip>) might be at the top of the results.

♦ Microsoft Windows:

Microsoft provides an official Technical Documentation (<https://learn.microsoft.com/en-us/>) page for its products. The screenshot below shows the search results for the command **ipconfig**.

The screenshot shows the Microsoft Learn website's search interface. The top navigation bar includes the 'Learn' logo and links for 'Discover', 'Product documentation', 'Development languages', and 'Topics'. A search bar on the left contains the text 'ipconfig' and a 'Search' button. Below the search bar, the results are categorized by 'Content area' and 'Products'. The 'Content area' section shows 'All' as the selected filter with 12K results, and other filters like 'Documentation' (252), 'Training' (0), 'Credentials' (0), 'Q&A' (824), 'Reference' (107), and 'Shows' (2). The 'Products' section shows a search bar and checkboxes for '.NET', 'Azure', 'Clarity', and 'Dynamics'. The search results for 'ipconfig' are displayed on the right, showing 1,185 results. The first result is 'ipconfig', a reference article for the Windows command. The second result is 'IPConfig interface', a JavaScript API for Azure ARM storage. The third result is 'Networking_IpConfig_EnableCustomDns function - Azure Sphere', a function for enabling custom DNS on Azure Sphere.

Search ipconfig Search

1,185 results for "ipconfig"

ipconfig

[/windows-server/administration/windows-commands/ipconfig](#)

reference article for the **ipconfig** command, which displays all current tcp/ip network configuration values and refreshes dynamic host configuration protocol (dhcp) and domain name system (dns) settings. **ipconfig** displays all current tcp/ip network configuration values and refreshes dynamic host configuration protocol (dhcp) and domain name ...

IPConfig interface

[/javascript/api/@azure/arm-storsimple1200series/ipconfig](#)

IPConfig interface Package: @azure/arm-storsimple1200series Details related to the IP address configuration Properties gateway The gateway of the network adapter. ipAddress The IP address of the network adapter, either ipv4 or ipv6. prefixLength The prefix length of the network adapter. Property Details gateway The gateway of the network adapter.

Networking_IpConfig_EnableCustomDns function - Azure Sphere

[/azure-sphere/reference/applibs/applibs-networking/function-networking-ipconfig-enablecustomdns](#)

Parameters **ipConfig** A pointer to the Networking_IpConfig struct to update. **dnsServerAddresses** A pointer to an array of DNS server addresses. **serverCount** The number of DNS server addresses in the **dnsServerAddresses** array. **Errors** Returns -1 if an error is encountered and sets **errno** to the error value.

- ◆ Product Documentation

Every popular product is expected to have well-organized documentation. This documentation provides an official and reliable source of information about the product features and functions. Examples include Snort Official Documentation (<https://www.snort.org/documents>), Apache HTTP Server Documentation (<https://httpd.apache.org/docs/>), PHP Documentation (<https://www.php.net/manual/en/index.php>), and Node.js Documentation (<https://nodejs.org/docs/latest/api/>).

It is always rewarding to check the official documentation as it is the most up-to-date and offers the most complete product information.

Q1) What does the Linux command **cat** stand for?

Answer: concatenate

Q2) What is the **netsta** parameter in MS Windows that displays the executable associated with each active connection and listening port?

Answer: **-b** (**netstat /?**)

>> Task 7: Social Media

There are billions of users registered on social media platforms such as **Facebook**, **Twitter**, and **LinkedIn**. We expect you to be familiar with popular platforms. However, if you are aware of any platform you are not familiar with, we recommend that you check it out and learn about it. Ideally, one would want to explore a platform without creating an account; however, this severely limits your experience. Instead, one recommendation is to use a temporary email address to discover these platforms without linking them to your real email addresses; once done, you can terminate the accounts and associated email addresses. One reason for not using your primary account is that you don't want your contacts to start connecting with you there when you are only temporarily exploring a platform.

The power of social media is that it allows you to connect with companies and people you are interested in. Furthermore, social media offers a wealth of information for cyber security professionals, whether they are searching for people or technical information. Why is searching for people important, you ask?

When protecting a company, you should ensure that the people you protect are not oversharing on social media. For instance, their social media might give away the answer to their secret questions, such as, "Which school did you go to as a child?". Such information might allow adversaries to reset their passwords and take over their accounts effortlessly.

Furthermore, as a cyber security professional, you want to stay updated with new cyber security trends, technologies, and products. Following the proper channels and groups can provide a suitable environment for growing your technical expertise.

Besides staying updated via social media channels and groups, we should mention news outlets. Hundreds of news websites would offer valuable cyber-security-related news. Try different ones and stick with the ones you like most.

Q1) You are hired to evaluate the security of a particular company. What is a popular social media website you would use to learn about the technical background of one of their employees?

Answer: LinkedIn

Q2) Continuing with the previous scenario, you are trying to find the answer to the secret question, "Which school did you go to as a child?". What social media website would you consider checking to find the answer to such secret questions?

Answer: Facebook
